Target: Data Analyst Intern | Location: Hangzhou

SUMMARY

Master's student in Business Analytics with a combined background in economics, statistics and data analysis, targeting data analyst roles in data analysis and e-commerce. Proficient in SQL for data extraction, multi-table joins, group aggregation, CTEs, subqueries, window functions and business metric calculation; skilled in Python/Pandas for data cleaning, metric analysis and visualization, with solid understanding of machine learning modeling, regression analysis, classification models and model evaluation. Developed the ARDashboard (accounts-receivable management dashboard) full-stack at Maxcess (a foreign company), gaining hands-on experience in ERP data extraction, MySQL data modeling and FastAPI/Vue dashboard delivery, and able to use AI coding tools (CodeBuddy, Codex) to assist SQL, ETL scripts and frontend/backend development; completed a data analysis internship at Baidu analyzing search behavior, covering data cleaning, conversion funnel analysis and user segmentation across the search-click-browse chain; independently completed the MavenFuzzyFactory e-commerce database project, with experience in traffic channel analysis, A/B testing, page conversion analysis and business growth analysis.

EDUCATION

University of Macau | MSc in Business Analytics | Faculty of Business Administration | Macau 2025.08-2027.07

- GPA: 3.7/4.0, top 5% of the class; Core courses: Data Visualization, Data Science, Machine Learning, Database & Big Data Management (SQL), Statistical Learning & Data Mining, Python

Yunnan University of Finance and Economics | BSc in Trade Economics | School of Economics | Kunming 2021.09-2025.06

- GPA: 3.48/4.0, top 10% of the class; First-class scholarship for consecutive years; Majors: Economics, Statistics, Calculus, Linear Algebra, Econometrics

INTERNSHIPS

Maxcess | IT Data Development Intern 2026.05-2026.09

- Requirement analysis & metric alignment: aligned aging-bucket, overdue determination, prepayment write-off and DSO metric definitions across Finance, Supply Chain and IT, consolidating AR, receipts, shipments and GL data scattered in Kingdee K3 ERP into an analyzable MySQL data model, and producing standardized metric-definition documentation.
- Data modeling & ETL development: designed 18 business tables and 3 public views with "AR bill no. + period + ledger" composite unique keys for deduplication; wrote Python extraction scripts to periodically sync ERP data to MySQL, accumulating 23K AR detail rows, 1.09M shipment rows and 18K receipt/write-off rows, covering 5 settlement orgs, 1,200+ customers, 23 sales reps and 4 currencies.
- AI-assisted full-stack development: using existing backend templates and CodeBuddy/Codex AI assistants, developed and tuned 27 FastAPI+SQLAlchemy backend APIs and 4 Vue3+ECharts frontend pages, implementing multi-table joins, multi-currency USD conversion and automatic 7-bucket aging, with line-by-line review of AI-generated SQL metrics and boundary conditions.
- Visualization & delivery: deployed via Nginx to the corporate intranet for daily Finance/Sales use, replacing the manual Excel reporting process; a single aging & overdue report dropped from ~4 hours to within 10 minutes, with overdue customers, collection commitments and prepayment write-off status visually tracked.

Baidu | Data Analyst Intern 2026.03-2026.04

- Business analysis positioning: focused on Baidu's core search business chain, used SQL, Python and Excel for dedicated analysis of user search behavior, traffic channel distribution and the search-click-browse conversion funnel, mining core factors such as search-result ranking, keyword type, traffic source and device type, and identifying existing problems and 2 key conversion drop-off points.
- Data cleaning: queried and filtered user search-behavior data with SQL, independently processed 100K user search-behavior log rows covering 18 fields including user ID, search time, device type, traffic source, keyword type, search-result ranking, click behavior and browse behavior; used Python Pandas for missing-value detection, outlier handling, field standardization and feature derivation to build a standardized analysis dataset.
- User segmentation analysis: performed user segmentation and behavior profiling with Python, breaking down click and browse performance by 4 traffic channels, 4 keyword types, 2 device types and 5 city tiers; built the full search-click-browse

conversion funnel, quantifying ~30.0% search-to-click and ~9.8% click-to-browse drop-off, and used Pandas/SQL for multi-dimensional metric statistics and attribution analysis.

- Visualization: created 10 professional charts with Matplotlib and Seaborn covering traffic source distribution, device differences, keyword-type CTR, search time-of-day trends and user browse conversion funnels; delivered one phased analysis report to support search-funnel optimization, traffic channel evaluation and subsequent strategy adjustment.

Industrial Bank, Taizhou Branch | Data Analyst Intern

2025.06-2025.09

- Credit-risk data analysis support: participated in corporate credit-risk data analysis, assisting analysts in extracting corporate financial, transaction-flow and basic information from business databases, understanding the logic behind profitability, solvency and operational-stability risk indicators, and helping organize baseline data tables for customer risk analysis.
- Data cleaning & quality checks: assisted with SQL/Excel completeness and consistency checks on customer basic information, financial indicators and transaction data, identifying missing values, duplicate records and abnormal fields, and maintaining a data-quality issue list for better post-loan management and risk analysis.
- Reporting & business support: participated in department monthly report compilation, helped maintain standardized Excel filing templates, and used pivot tables, basic functions and data-validation to improve data entry and checking efficiency; followed up on loan officers' post-loan data needs and understood how data analysis supports customer risk identification and business decisions.

PROJECTS

ARDashboard AR Management Dashboard | Corporate Internship Project

2026.06-2026.09

- Background: AR management relied on Finance manually exporting multiple Excel sheets from Kingdee K3 each month to compile aging and overdue reports, with inconsistent metrics and lagging updates, and no visual tracking of overdue collections or prepayment write-offs; the goal was to connect the AR, receipts, shipments and GL data chain and build an integrated dashboard covering aging structure, overdue distribution and DSO trends.
- Data modeling & sync: designed 18 MySQL tables (AR details, unbilled, receipt bills, write-off records, account balances, exchange rates) and 3 views with unique keys and incremental-sync rules; wrote Python extraction scripts to connect Kingdee K3 for field mapping, deduplication and incremental loading, supporting stable queries of millions of detail rows from 2013 to 2026, and added a separate refund DB linking refund bills to source receipt bills.
- Metric calculation & API development: used SQL multi-table joins, CASE WHEN grouping, date functions and aggregations to implement automatic 7-bucket aging ("Uninvoiced/Not Due/Due/Overdue 1-30/31-60/61-90/91+"), multi-currency LC and USD conversion, org-sales-customer three-level aggregation and DSO calculation; delivered 27 FastAPI query APIs supporting drill-down from customer summaries to individual AR bill details.
- Visualization & delivery validation: developed KPI cards, currency-grouped summary tables with auto-injected subtotal and total rows, a customer detail drawer and DSO/aging trend charts with Vue3 + Element Plus + ECharts, covering 5 settlement orgs and 1,200+ customers; generated and optimized SQL and frontend components with AI assistants, validated metrics manually, and deployed to the intranet, cutting report generation from ~4 hours to within 10 minutes.

MavenFuzzyFactory E-commerce User Behavior & Conversion Analysis | Course Project

2026.01-2026.05

- Background: SQL data analysis on the Maven Fuzzy Factory e-commerce database covering website traffic, user behavior paths, page conversion efficiency and marketing channel performance, using core tables such as website_sessions, website_pageviews, orders, order_items, products and order_item_refunds.
- Traffic channel analysis: used SQL multi-table joins, GROUP BY, CASE WHEN and aggregate functions to break down session, order and CVR performance across gsearch, bsearch, organic search and direct type-in channels; further analyzed channel quality by brand/nonbrand, device type and utm_source to inform ad-budget allocation and keyword-bidding strategy.
- Page conversion & A/B testing: performed A/B testing analysis of the /home and /lander-1 landing pages, building landing-page session datasets with temp tables/CTEs to compute total sessions, bounced sessions and bounce rate; results showed the new landing page had a lower bounce rate than the home page, supporting page-optimization decisions.
- User behavior funnel & business growth: built a full-funnel conversion path (Home/Landing, Product, Product Detail, Cart, Shipping, Billing, Payment Success) from website_pageviews to locate key drop-off nodes; extracted sessions, orders and CVR by month/week, analyzed business trends for brand/nonbrand and mobile/desktop, and interpreted the results.

Analysis of Factors Influencing Search Click Behavior | Baidu Extension Project

2026.03-2026.04

- Data & feature engineering: built a click-behavior analysis framework on search logs, cleaning missing and abnormal click-time and browse-duration records with Python/Pandas, and constructing features such as search-result ranking, keyword type, device type, traffic source, time slot and first-click latency, with whether the user clicked defined as the target variable.

- Modeling & business conclusions: used a binary logistic regression model to analyze the impact of different features on click behavior, evaluating the model with accuracy, recall and AUC; summarized the core factors affecting CTR to support search-result ranking optimization, keyword strategy adjustment and recommendation material optimization.

HONORS & AWARDS

- National College Students Statistical Modeling Competition - Provincial Third Prize | 2024: applied XGBoost and other ML algorithms to gold data, completing data preprocessing, feature engineering, model training and result analysis.
- MCM Mathematical Contest in Modeling - Honorable Mention | 2023: used R for factor extraction, regression analysis and modeling, with competition experience in statistical analysis and modeling.

SKILLS

- Data analysis: proficient in SQL for data extraction, table joins, group aggregation, window analysis, CTEs, subqueries and business metric calculation; familiar with Excel pivot tables, basic functions and data cleaning.
- Programming & modeling: proficient in Python data-analysis workflows, using Pandas, NumPy and Matplotlib (with AI assistance) for data cleaning, metric calculation, visualization and project analysis; familiar with statistical analysis and machine learning, including regression, classification, feature engineering and model evaluation.
- Data development: hands-on MySQL data modeling and ETL extraction (table design, unique-key deduplication, incremental sync); familiar with FastAPI+SQLAlchemy backend API development and Vue3+ECharts dashboard visualization; practical experience using AI coding tools (CodeBuddy, Codex) to assist SQL, ETL scripts and frontend/backend development.
- Others: familiar with basic Tableau; proficient in R for statistical modeling, factor analysis and regression; IELTS 6.0, CET-6.
